Meet the Team

School of COMPUTING Clemson University

MICHELIN

Uzayr Syed

I'm a Computer Science student with a background in SWE , AI, and data-driven systems. Professionaly I've created a React/Python app at Global Payments to identify SDLC bottlenecks, supporting efforts in mitigating over $365M of potential losses, and developed an automated data ingestion pipeline at Watershed Ventures using Python & Zapier to ingest data from 100+ companies. In addition to my technical work, I founded Clemson Forge, a fellowship program helping 80+ students build real-world software projects, and serve as Finance Director for CUhackit, Clemson's annual hackathon, where I manage a $30K+ budget and lead development of the organization's website.

Nathan Londhe

I am a senior Computer Science major and AI minor, with three years of internship working at Clemson Athletics and Dominion Energy with a focus on data science and ML. At Clemson Athletics, I have worked on several projects evaluating various predictive ML models in Python, building ETL functions, and analyzing business operations using SQL and PowerBI. Alongside this, at Dominion Energy, I utilized Salesforce to reduce lengthy workflows of internal teams. I bring strong collaboration and communication skills from interning in industry, where I worked with a team of developers, communicating with technical and non-technical clients.

Jason Ferraro

I am a senior Computer Science student with an emphasis in intelligent computing systems. At Clemson, I have helped develop an AWS-based API for a simulated food delivery service, designed a prototype for a user-centered course registration platform, and leveraged machine learning to analyze the drivers of economic growth across U.S. regions. Most recently, I participated in a research group dedicated to exploring the use of AI and machine learning in medicine, focusing on the classification of disease-associated genes related to autism and cancer. I am especially interested in the ethical development and use of emerging technologies to meaningfully improve people's lives.

Jacob Viehe

I am a Computer Science major with a minor in Artificial Intelligence, with experience in LLM integration and analytical model design. At BMW, I designed and deployed LLM-powered chatbots to address operational needs across multiple departments and analyzed customer data to support data-driven decisions. My academic work includes designing a convolutional neural network (CNN) for the PhysioNet Challenge, strengthening my skills in applied machine learning and real-world data analysis. I am a dedicated and collaborative problem-solver who enjoys tackling complex challenges and building impactful AI-driven solutions.
